
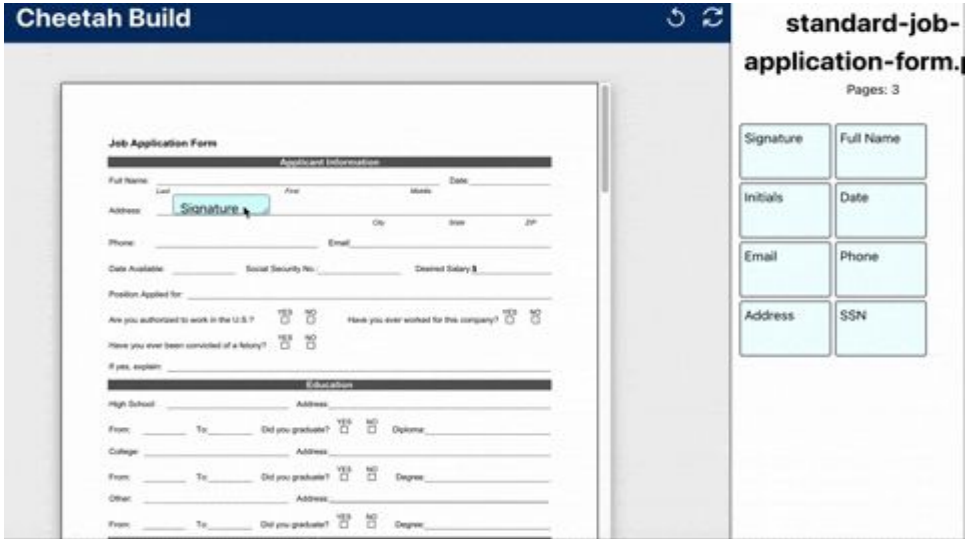
Cheetah Sign

Iteration 5

Levi Shelley, Riley Jamison,
Tia Self

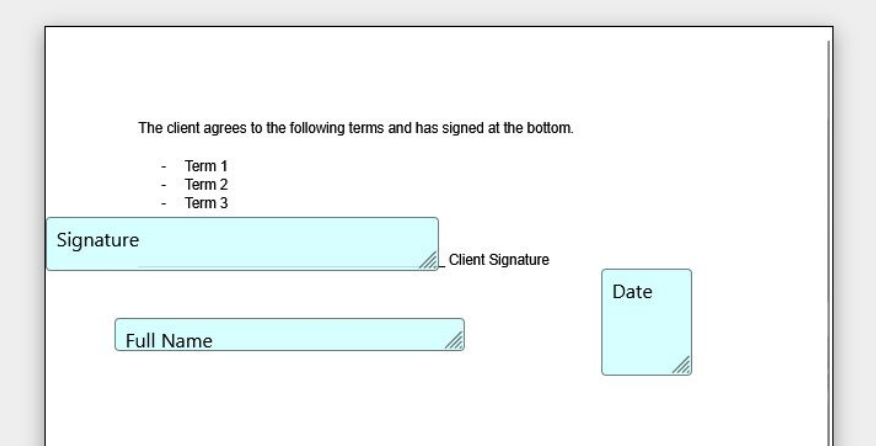
New Features: Drag and Drop

- Drag and Drop allows boxes to be brought over and moved on the document
- Easy to adjust, precise placing, and no more misclicks
- **Improves the quality and efficiency of document sending, making the process better for Administrators.**



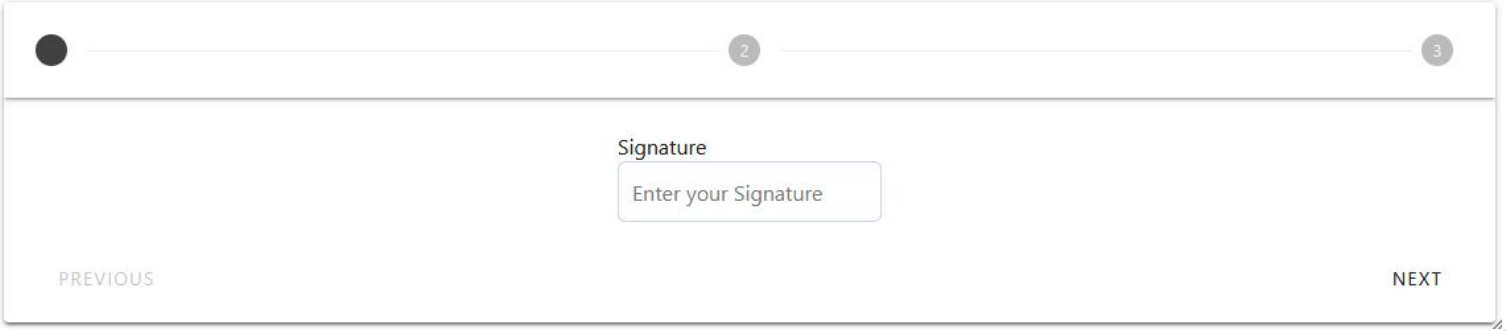
New Features: Resizing Boxes

- Boxes placed on the document can be changed to a desired width and height for more flexibility
- Allows for more precise shaping of boxes
- **This allows Administrators to have better accuracy within their documents**



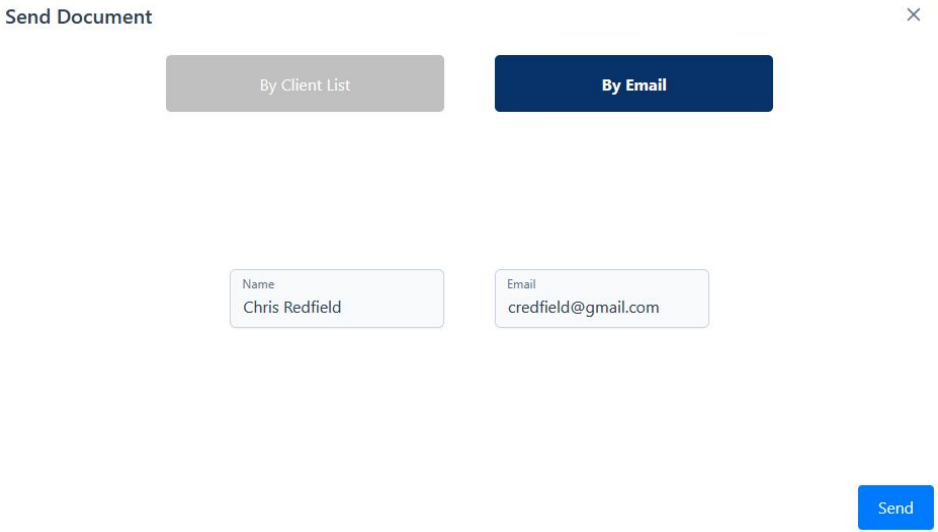
New Features: Form Filling

- On the signing page, forms are no longer handled by pdf boxes
- Forms are filled out by a stepper at the bottom of the PDF that walks you through each input
- **This improves stability of the document signer, ensuring that admin and clients have less issues with filling out info**



New Features: Email Sending

- Proper email sending has been mostly implemented
- Currently connected to my email (Riley Jamison) with the alias 'Cheetah Sign'
- **Creates the functionality that allows Admin to properly send emails to actual clientele**



Feedback

Mentor Feedback

- Gabriel was very happy with the overall look and feel of our project! We've made great strides with his feedback, and greatly appreciate it!
- He didn't give very much feedback towards the end of iteration 5 here - just that he was proud of the progress that we've made and commented that we were an amazing group to work with.

Client Feedback

- UI looks significantly better!
- Very happy with the improvements to the document builder - very large jump from iteration 4 to iteration 5 in the right direction.
- Happy that documents with multiple pages are supported
- Overall looks very professional and feels like a polished product
- Our efforts prove to them that this is something they would want to pursue integrating into their Cheetah Flow engine

Client Use

- Client use was very smooth! No issues with drag and drop.
- Would love pre-fill for the documents based on client info that has already been input.
- When going to re-build a document, it would be nice to re-edit the fields that were there before.
- The steps to build a document might be a bit uncomfortable - maybe something more guiding could help the average user.

Teamwork

Levi

- I learned a significant amount about backend testing, as well as understanding that an application will lack completeness with glaring bugs. My main tasks were backend testing, fixing job documents, and cleanup.

Riley

- My main tasks were UI, Document Builder drag n drop, recipient form filling, frontend unit testing + integration testing, and cleaning up various features.

Tia:

- My main task this iteration was assisting with updates to the UI.

always has been.
wait, it's all
cheetah?
